

Model Essay

Model Essay

Note

Official fact (2026 Class C sample paper):

Section A is a chart/report task in 100–120 words ;

Section B is an opinion essay in 140–180 words .

Coaching suggestion:

keep Section A close to 110 words and Section B close to 160 words so that the structure stays complete without crossing the word-limit penalty line.

Section A

Tip

Each model below follows the NECCS C-Class Section A logic:

introduce the chart -> give an overview -> describe key figures -> end with a summary / brief inference .

1. Line Graph: Online Course Participation

Prompt Type: report on a line graph

The line graph describes the changes in the percentage of college students taking online courses from 2020 to 2024. Overall, a striking feature is that online course participation rose steadily over the period.

As can be seen from the graph, the figure stood at 18 percent in 2020 and then increased gradually to 27 percent in 2021. After that, it jumped to 39 percent in 2022 and continued to grow, reaching the highest point of 55 percent in 2024. It is noticeable that the sharpest rise occurred between 2021 and 2022, when online learning gained significant traction among students.

To conclude, the graph reveals a clear pattern that digital learning has become increasingly popular. Taken together, the data suggest that flexibility and convenience play a crucial role in students' choices.

2. Pie Chart: Students' Weekend Activities

Prompt Type: report on a pie chart

The pie chart provides data on college students' main weekend activities. In general, the data reveal a clear pattern that entertainment and study occupy the largest proportions.

As we can see from the chart, watching videos ranks first, accounting for 30 percent of all responses. Self-study takes the second place, making up 25 percent. Sports and social activities account for 20 percent and 15 percent respectively. By contrast, part-time work represents only 10 percent of the total. The most obvious pieces of information are that leisure-related activities remain dominant, while work-related choices form the smallest share.

To sum up, students tend to value relaxation more than productivity on weekends. As far as I am concerned, a better balance between rest and self-improvement would be of vital importance.

3. Bar Chart: Transport Choices of University Students

Prompt Type: report on a bar chart

The bar chart shows the comparison of transport choices among university students in one city. Overall, there are great differences between the five means of transport shown in the chart.

As is shown in the chart, taking the subway ranks first, accounting for 35 percent of all choices. Buses take the second place at 28 percent, followed by bicycles at 18 percent. By contrast, private cars account for only 12 percent, while taxis make up a mere 7 percent. It is important to note that public transport together constitutes well over half of the total, which is almost as high as all the other choices combined.

All in all, the chart reveals a clear pattern that convenience and cost strongly affect students' decisions. Therefore, we should not ignore the value of efficient public transport on campus.

Section B

Each model below follows the NECCS C-Class Section B logic:

background -> clear opinion -> reason 1 + example -> reason 2 + example -> conclusion .

1. Education Theme: Practical Skills and University Education

With the rapid development of society and the ever-changing job market, university education has become the focus of public concern. That leads us to the question: should colleges place greater emphasis on practical skills?

From my perspective, the answer is yes. The first reason lies in the fact that practical training helps students translate knowledge into practice. For example, internships, field research, and project-based learning provide hands-on experience that textbooks alone cannot offer. Another major reason is that such training can cultivate adaptability, communication, and teamwork. A case in point is that graduates with real-world experience are often better positioned to secure quality jobs and build professional credibility. This, in turn, strengthens their career resilience in times of uncertainty.

All things considered, university education should be not merely a process of knowledge delivery, but a path to all-round development. The key lies in striking a balance between academic study and practical growth. Only in this way can students prepare for the future more effectively.

2. Technology Theme: Technology Should Serve Human Development

In an era marked by rapid innovation, digital technology has become the focal point of public concern. There is little doubt that it has brought convenience, speed, and broader access to information. However, when it comes to human development, my view is that technology should serve people rather than dominate them.

The first reason lies in the fact that technology can enhance efficiency and unlock the value of educational and social resources. For example, online platforms allow learners in remote areas to draw on high-quality courses, thereby narrowing the digital divide to some extent. Another major reason is that intelligent tools can foster creativity and cooperation when used wisely. Nonetheless, it is plain to see that excessive dependence may give rise to distraction and information overload. It follows that society should build on innovation while adopting a more human-centered approach.

In conclusion, technology is a powerful tool, but it is not an end in itself. From a long-term perspective, the key lies in wise guidance, ethical awareness, and self-discipline. Only in this way can innovation stand the test of time.

3. Employment Theme: How College Students Can Improve Employability

Amid growing public attention, graduate employment has become the focus of public concern. Gone are the days when a university degree alone guaranteed upward mobility. Today, students need much more than academic scores.

As far as I am concerned, college students can improve employability mainly through active preparation and broader competence. The first reason lies in the fact that students should take the initiative to equip themselves with professional and working skills. For example, communication, problem-solving, and digital literacy are future-proof skills highly valued by employers. Another major reason is that students need to have a good knowledge of the job-seeking process instead of waiting passively for opportunities. A case in point is that those who attend internships and career workshops are often better positioned to find ideal jobs after graduation. This, in turn, improves both confidence and professional credibility.

To conclude, employability does not stem from a single certificate. The key lies in sustained effort, practical experience, and clear career planning. Only in this way can young people remain resilient in a competitive world.

4. Culture Theme: Learning Foreign Culture and One's Own Culture

With the popularization of global communication, foreign culture has gained significant traction among young people. It comes as no surprise that many students enjoy foreign films, music, and festivals. Yet that leads us to the question: should they spend more time learning about their own culture?

From my perspective, they should. The first reason lies in the fact that one's own culture lays a solid foundation for identity and confidence. For example, without a basic understanding of traditional values, literature, and customs, young people may find it difficult to explain China to the outside world. Another major reason is that cultural learning does not run counter to openness; rather, it makes communication more meaningful. A case in point is that students who know both local and foreign culture are better positioned to engage in intercultural exchange. This can be best illustrated by the growing demand for talents who can tell China's stories well.

All things considered, learning foreign culture is beneficial, but it should not overshadow the study of our own traditions. The key lies in balance. Only in this way can cultural confidence and global vision develop together.

5. Social Responsibility Theme: Should Companies Be Socially Responsible?

We are living in an era when corporate behavior is increasingly the focus of public concern. It is no exaggeration to say that companies now influence not only the economy but also the environment and public life. When it comes to social responsibility, my view is that businesses should never focus on profit alone.

The first reason lies in the fact that responsible behavior can enhance public trust and professional credibility. For example, companies that protect user privacy and improve labor conditions are more likely to win broad acceptance. Another major reason is that irresponsible behavior often runs counter to sustainable development. A case in point is that pollution, false advertising, and unsafe products may bring short-term gains, but they damage long-term value and may give rise to serious social costs. At the very least, businesses should be accountable for the impact they create.

In conclusion, profit matters, but social responsibility is of vital importance as well. The key lies in balancing commercial success with public interest. Only in this way can companies retain their relevance and achieve lasting development.

Quick Use

Example

Fast imitation method:

1. choose the closest model;
2. keep the structure unchanged;
3. replace topic words, examples, and key conclusion;
4. keep the opening, linker, and closing sentences as much as possible.
